Unclear choices in a fuzzy,
crowded and cluttered PGR market.

The Clear Choice for Top Quality.

Introducing New Topflor® Ornamental Plant Growth Regulator.

Production ornamental plant producers are "tuning in" to the new, all-in-one PGR that is active on the broadest range of crops, can be applied with a wide variety of application techniques and demonstrates more efficient plant uptake when compared to other PGRs. Topflor is a liquid flurprimidol formulation that can be used on container-grown ornamentals in commercial nurseries, greenhouses, or shadehouses to make plants more desirable to the consumer by regulating their height while improving their shape, heartiness and quality.

Topflor regulates even the most vigorous varieties to enhance plant quality and pre-condition plants to handle the stress of the retail sales environment. Until now, the search for the ideal PGR for the right crop at a given time has been fuzzy. Today the choice is clear—eliminate the need for multiple PGRs with Topflor. For more information about Topflor Ornamental Plant Growth Regulator, visit our website at www.sepro.com or call 1-800-419-7779.

Warm weather growing leads to over shading in an effort to combat heat. There is a better way to grow without drastically changing your practices. Results from a recent study show that using a higher efficiency climate screen significantly reduces heat gain. Less heat gain means lower leaf temperature and less water consumption. This can allow you to deliver more light to the crop aiding faster and fuller growth.

FLS attributes/benefits:

- Highly reflective against light and heat
- Reduces water consumption
- Long-lasting

What climate do you need?
